

Abstract

3 A circuit board holder has or is provided with a face
4 plate and with walls projecting from an inside of that
5 face plate. A pair of opposite ones of such walls are
6 equipped with circuit board retainers. Such retainers may
7 be inside and/or outside of a space in the circuit board
8 holder. The circuit board holder is equipped with one or
9 more holder retainers or resilient snaps for releasably
10 retaining that circuit board holder in an aperture of a
11 panel. Such holder retainers or resilient snaps may have
12 serrations for engaging panels of different thicknesses at
13 their apertures. Such panel may be provided with a slot
14 or slots at that aperture for access to the holder
15 retainer or resilient snap through the panel. The holder
16 retainer or resilient snap may be released through such
17 slots, such as by screwdrivers or other release tool, for
18 removal of the circuit board holder or similar device from
19 the panel.
